In which n is 1 to 4 and R_1 to R_7 are as defined in claim 1, can be used, in combination with sterically hindered amines of the polyalkylpiperidine type, for stabilizing organic polymers. Some of these compounds are novel and can also be used without polyalkylpiperidine.

EP 0 434 608 A1

STABILIZED ORGANIC MATERIAL

The present invention relates to an organic material containing, as stabilizers, a mixture of a sterically hindered amine and an o-hydroxyphenyl-s-triazine, and to novel o-hydroxyphenyl-s-triazine.

It is already known from US-Patent 4,619,956 that polymers can be stabilized against the action of light, moisture and oxygen by adding a mixture of a sterically hindered amine and an o-hydroxyphenyl-s-triazine. The triazines used in this context contain at least one phenyl group carrying a hydroxyl group in the o-position.

Triazine compounds of this type are relatively sparingly soluble in many substrates and tend to migrate. In accordance with the present invention, similar triazine derivatives which have an improved compatibility with or solubility in organic polymers are used.

The invention relates to an organic material which has been stabilized against damage caused by light, heat and oxygen and which contains

- (a) at least one sterically hindered amine of the polyalkylpiperidine type and
- (b) at least one o-hydroxyphenyl-s-triazine, wherein the triazine compound (b) is a compound of the formula I

10

The compounds of the formula Ia in which n is 2 are also preferred.

In general, the compounds of the formula I and Ia can be prepared by introducing the radical R_7 into the p-hydroxyl group in a compound of the formula II

15

20

25

30

II.

The compounds of the formula II are known compounds and can be prepared by a Friedel-Crafts reaction between cyanuric chloride and 1 mole of an aromatic compound of the formula

35

40

and 1 mole of an aromatic compound of the formula

45

50

and 1 mole of resorcinol, as described, for example, in Swiss Patent 480,091 or in Swiss Patent 484,695 or in US Patent 3,244,708.

55

The conversion of II into I can be effected by various processes known per se, depending on the nature of the radical R_7 . If R_7 is substituted alkyl, alkenyl, glycidyl, phenylalkyl, $-CO-R_{12}$, $-SO_2-R_{13}$, alkylene, alkenylene, xylylene or $-COR_{16}CO-$, the compound II or an alkali metal salt thereof can be reacted with a halogen compound of the formula $Hal-R_7$ or $Hal-R_7-Hal$ in which Hal is chlorine, bromine or iodine, in particular with the compounds $Cl-R_7$ and $Cl-R_7-Cl$.

If R₇ is a group

in which R' is hydrogen or CH₃ and Y is -COOR₈, -CONH₂, -CONHR₉, -CON(R₉)(R₁₀) or -CN, the compounds can be prepared by reacting a compound of the formula II with a compound of the formula

in the manner of a so-called Michael addition reaction.

If R₇ is a group -CH₂CH(OH)-W in which W is alkyl, phenyl, phenylalkyl or -CH₂OR₂₁, such compounds can be prepared by reacting a compound of the formula II with an epoxide of the formula

Analogously, compounds of the formula I in which n is 2 and R₇ is a group -CH₂CH(OH)CH₂O-R₁₅-OCH₂CH(OH)CH₂-, can be prepared by reacting 2 moles of a compound II and 1 mole of a bis-glycidyl ether of the formula

Compounds of the formula I in which R₇ is cyclohexyl substituted by OH can be prepared by reaction of II with cyclohexene oxide.

Compounds of the formula I in which n is 2 and R₇ is -CO-NH-R₁₇-NH-CO- can be prepared by reacting 2 moles of a compound of the formula II with 1 mole of a diisocyanate OCN-R₁₇-NCO. Compounds of the formula I in which n is 2 and R₇ is a group -CH₂CH(OH)CH₂- can be prepared by reacting 2 moles of a compound II with 1 mole of epichlorohydrin.

Compounds of formula I or Ia wherein n is 1 and R₇ is a group

-CONH-R₁₇-NCO can be prepared from II by reaction with one molar equivalent of a

It is also possible to convert a compound of the formula I into another compound of the formula I. For example, a hydroxyalkyl or aminoalkyl radical R₇ can be converted by acylation with R₁₁COCl into the corre-

spending acyloxy or acylamino derivative.

Or a cyanoalkyl radical R_7 can be converted by reduction into an aminoalkyl radical. Compounds in which R_7 is alkyl which is substituted by $-\text{COOR}_8$ can be transesterified with another alcohol or polyol.

The methods required for the individual stages of the synthesis are known to those skilled in the art ; some of them are described in greater detail in the examples which follow later.

The use of the compounds according to the invention in coatings of all types is particularly preferred. These can be pigmented or unpigmented coatings or metal effect coatings. They can contain an organic solvent or can be solvent-free or can be aqueous coatings.

The coatings can contain, as a binder, at least one of the polymers listed above. The following are examples of coatings containing special binders :

1. Coatings based on cold-crosslinkable or hot-crosslinkable alkyd, acrylate, polyester, epoxy or melamine resins or mixtures of such resins, if desired with an added acid curing catalyst ;

The coatings can also be radiation-curable. In this case the binder is composed of monomeric or oligomeric compounds which contain ethylenic double bonds and are converted into a crosslinked, high-molecular form by irradiation with actinic light or with electron beams. In most cases the binder is a mixture of such compounds. In radiation-curable coatings the compounds of formula I can be used also in absence of a sterically hindered

amine.

The coatings can be applied as one-coat or two-coat systems, it being preferable to add the stabilizers according to the invention to the unpigmented top coat.

The coatings can be applied to the substrates (metal, plastic, wood, etc.) by the customary processes, for example by brushing, spraying, curtain-coating, dipping or electrophoresis.

The amount of (a) and (b) added depends on the substrate and the requirements for its stability. In general, 0.01 to 5% by weight, in particular 0.02 to 2% by weight, of the component (a) and 0.02 to 5% by weight, in particular 0.05 to 3% by weight, of the component (b) are added, relative to the polymer.

The two components can be added on their own or as a mixture. Addition is preferably carried out before or during the shaping of the polymer. It can also be carried out as early as the preparation of the polymer, for example before or during polymerization.

The compounds of the formula Ia can also be used on their own, i.e. without a sterically hindered amine, for stabilizing organic polymers. In this case 0.01 to 10% by weight, for example, preferably 0.05 to 5% by weight, of a compound of the formula Ia is added to the polymer. The use of compounds of the formula Ia as a stabilizer for polycarbonates is of particular interest.

In addition to the stabilizers, according to the invention, of the formula Ia or the stabilizer combination (a) + (b), it is also possible to add other stabilizers to the polymer. The following are examples of these:

6 The following examples illustrate the invention in greater detail without intending to limit it to the examples. Parts and percentages are parts by weight and percentages by weight.

Example 1: 23.8 g (0.06 mol) of 2-(2,4-dihydroxyphenyl)-4,6-bis-(2,4-dimethylphenyl)-1,3,5-triazine (prepared as described in US Patent 3,244,708 Example 16) are suspended in 300 ml of xylene. 12.1 g (0.09 mol) of 97% butyl glycidyl ether and 0.75 g (0.006 mol) of dimethylbenzylamine are added to this suspension, and the mixture is heated to reflux temperature. After a reaction time of 5 hours the clear, brownish solution is cooled and clarified by filtration through 100 g of silica gel. The yellow solution is evaporated and the residue is recrystallized from hexane/toluene. This gives 27.3 g of pale yellow crystals of 2-[2-hydroxy-4(3-butoxy-2-hydroxypropyloxy)-phenyl]-4,6-bis(2,4-dimethylphenyl)-1,3,5-triazin (= 86% yield). Melting point: 80-83°C (Compound 1).

Example 4: 9.1 g (0.02 mol) of 2-(2-hydroxy-4-carboxymethoxy-phenyl)-4,6-bis(2,4-dimethylphenyl)-1,3,5-triazine (prepared as described in US Patent 3,244,708, Example 16) are suspended in 40 ml of thionyl chloride, and 1 ml of DMF is added. This solution is evaporated to give 9.5 g of [4-(4,6-di-2',4'-xylyl-s-triazin-2-yl)-3-hydroxyphenoxy]-acetyl chloride (Compound 38). This acid chloride is dissolved in 100 ml of toluene. 19.3 g (0.08 mol) of bis-(2-ethylhexyl)-amine are added dropwise at room temperature. The reaction proceeds exothermically from 22°C to 40°C. The mixture is left for 1 hour at room temperature to complete the reaction. The product is then purified by column chromatography over silica gel. This gives approx. 5 g of a pale yellow, highly viscous oil, [4-(4,6-di-2',4'-xylyl-s-triazin-2-yl)-3-hydroxyphenoxy]-acetic acid bis-(2-ethylhexyl)-amide (Compound 39).

Example 15 : Stabilization of a 2-coat metallic coating

A clear lacquer is prepared by mixing the following components :

59.2	Parts of a commercial acrylic resin (Uracron® XB 2263, DMS Resins BV, NL) which is a 50% solution in xylene,
11.6	parts of a 90% melamine resin (Cymel® 327, Amer. Cyanamid Corp.)
19.4	parts of xylene
5.5	parts of butylglycol acetate
9.3	parts of butanol
1.0	part of a levelling agent (Baysilon® A, Bayer AG) which is a 1% solution in xylene
100	parts lacquer containing 40% solids.

Samples of this lacquer are mixed with 0.5% (related to the solids) of di(1,2,2,6,6-pentamethylpiperidin-4-yl) sebacate (= HA-1) and 1.5% (related to the solids) of a triazine stabilizer listed in table 6.

The clear lacquer is diluted to a sprayable state with a mixture of 13 : 6 : 1 xylene/butanol/butyl glycol acetate and is sprayed onto a previously prepared aluminum sheet (coil-coated and primed with a silver-metallic paint based on polyester/cellulose acetobutyrate/melamine resin), and the sheet is baked for 30 minutes at 130°C. This results in a dry film thickness of 40-50 μm of clear lacquer. A clear lacquer containing a light stabi-

lizer is used as a comparison.

The samples are exposed in a UVCON, Type UVB-313, weathering equipment with a cycle of 8 hrs of dry UV irradiation at 70°C and 4 hrs of condensation at 50°C. The 20°-gloss of the samples is measured in certain intervals of weathering time using the method of DIN 67530. The results are given in Table 6.
